

免电感滤波2*20W D类立体声音频功放

■ 特点

- 输出功率（BTL模式）
2×20W ($V_{DD}=14.5V$, $R_L=4\Omega$, THD+N=1%)
2×25W ($V_{DD}=14.5V$, $R_L=4\Omega$, THD+N=10%)
- 输出功率（PBTL模式）
24W ($V_{DD}=15V$, $R_L=4\Omega$, THD+N=1%)
30W ($V_{DD}=15V$, $R_L=4\Omega$, THD+N=10%)
- 单电源系统，4.5V-16V宽电压输入范围
- 超过90%效率，无需散热器
- 扩频功能，免电感滤波
- 模拟差分/单端输入，输出模式立体声/单声道可选
- 保护功能：过压/过流/过热/欠压异常，直流检测和短路保护
- 无铅无卤封装，SOP16-PP

■ 应用

- 条形音箱
- 便携式音箱
- 拉杆音箱
- 无线智能音箱
- 消费类音频应用
- LCD电视/监视器

■ 概述

HT360是一款高效D类音频功率放大器。在14.5V供电的立体声（BTL）模式下，能够持续提供2*20W/4Ω功率输出；在单声道（PBTL）模式下，能够持续提供30W/4Ω功率输出。

HT360具有先进的扩频功能来抑制EMI，使用价格低廉且小体积铁氧体磁珠可满足EMC要求。

此外，HT360内置关断功能使待机电流最小化，还集成了过压保护、直流保护、短路保护、热保护和电源欠压异常保护等功能，可全面防止出现故障。

■ 简化应用图

2*20W Inductor Free Class D Stereo Amplifier

FEATURE

- Output Power (BTL)
 - $2 \times 20W$ ($V_{DD}=14.5V$, $R_L=4\Omega$, THD+N=1%)
 - $2 \times 25W$ ($V_{DD}=14.5V$, $R_L=4\Omega$, THD+N=10%)
- Output Power (PBTL)
 - $24W$ ($V_{DD}=15V$, $R_L=4\Omega$, THD+N=1%)
 - $30W$ ($V_{DD}=15V$, $R_L=4\Omega$, THD+N=10%)
- Single Wide Voltage Supply: 4.5V-16V
- Efficiency > 90%
- Differential / Single-ended Analog Input, BTL or PBTL Output
- Spread Switching Frequency For Inductor Free
- Integrated Self-protection Circuits Including Overvoltage, Undervoltage, Overtemperature, DC-detect, and Overcurrent with Error Reporting
- LF and HF Package of SOP16-PP

APPLICATIONS

- Sound Bars
- Wireless Speakers
- Consumer Audio Applications
- TVs/Monitors

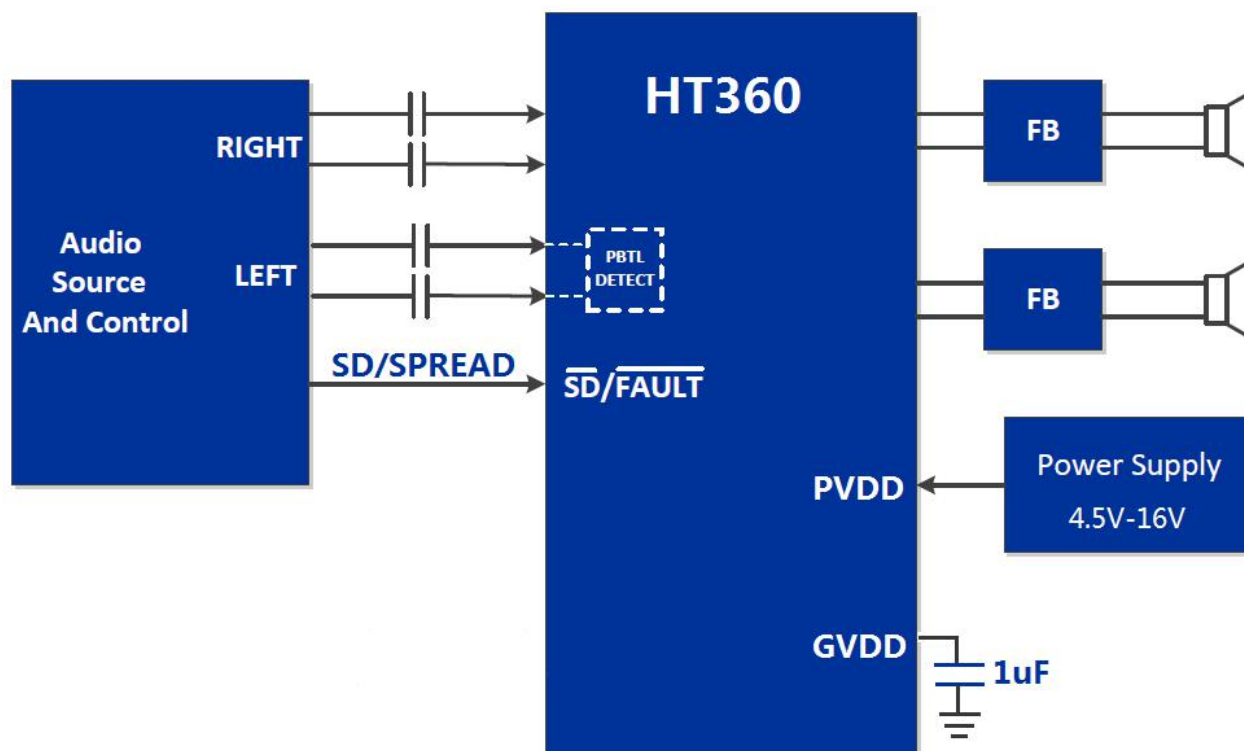

GENERAL DESCRIPTION

HT360 is a stereo efficient, Class-D audio amplifier for driving speakers up to $30W/4\Omega$ in mono PBTL. It can also deliver $2 \times 20W/4\Omega$ power in stereo BTL.

Advanced EMI Suppression with Spread Spectrum Control enables the use of inexpensive ferrite bead filters while meeting EMC requirements for system cost reduction.

HT360 is fully protected against faults with Overvoltage, Undervoltage, Overtemperature, DC-detect, and Overcurrent protection. Faults can be reported to the processor to prevent devices from being damaged

TYPICAL APPLICATION

■ TERMINAL CONFIGURATION

Pin No.	Name	I/O ¹	Description
1	PVDDL	P	Power Supply for amplifier drivers of L channel
2	\SD/FAULT	I	SD/FAULT, multi function pin. When pulled down, place the speaker amplifier in shutdown mode. General fault reporting including Over-Temp, Over-Current, DC Detect.
3	LINP	I	Positive input terminal for L channel
4	LINN	I	Negative input terminal for L channel
5	GVDD	O	Voltage regulator derived from PVDD supply, connect 1uF to GND (NOTE: This pin is provided as a connection point for filtering capacitors for this supply and must not be used to power any external circuitry)
6	RINN	I	Negative input terminal for R channel
7	RINP	I	Positive input terminal for R channel
8	PVDDR	P	Power Supply for amplifier drivers of R channel
9	BSPR	BST	Connection point for the ROUTP bootstrap capacitor, which is used to create a power supply for the high-side gate drive for ROUTP
10	ROUTP	O	Positive pin for differential speaker amplifier output R
11	ROUTN	O	Negative pin for differential speaker amplifier output R
12	BSNR	BST	Connection point for the ROUTN bootstrap capacitor, which is used to create a power supply for the high-side gate drive for ROUTN
13	BSNL	BST	Connection point for the LOUTN bootstrap capacitor, which is used to create a power supply for the high-side gate drive for LOUTN
14	LOUTN	O	Negative pin for differential speaker amplifier output L
15	LOU TP	O	Positive pin for differential speaker amplifier output L
16	BSPL	BST	Connection point for the LOU TP bootstrap capacitor, which is used to create a power supply for the high-side gate drive for LOU TP
PAD	PGND	G	Power ground, make sure connect it to the system ground

¹ I: Input; O: Output; G: Ground; P: Power; BST: Boot Strap

■ ORDERING INFORMATION

APPLICATION INFORMATION

1. Power Supply

The power supply for the HT360 only require one voltage from 4.5V to 16V, which supplies the analog circuitry and the power stage

The PVDD supply feeds internal LDO including GVDD. This LDO output is connected to external pins for filtering purposes, but should not be connected to external circuits. The filtering capacitor for GVDD is recommended to be 1uF.

The PVDD (pin1) feeds the power stage of L channel and the PVDD (pin7) feeds the power stage of R channel. Filtering capacitors of 100nF//1uF//220uF for PVDD of each channel should be placed close to the PVDD pin.

2. Amplifier Input and Output

2.1 Amplifier Input Configuration

HT360 is an amplifier with analog input (single-ended or differential). For a differential operation, input signals into IN+ and IN- pins via DC-cut capacitors (C_{IN}). The high pass cut-off frequency of input signal can be calculated by

$f_c = \frac{1}{2\pi(\text{External } R_{IN} + \text{Internal } R_{IN}) \times C_{IN}}$. The input signal gain is calculated by $\text{Gain} \approx R_F / (\text{External } R_{IN} + \text{Internal } R_{IN})$. The inter $R_F=400k$, inter $R_{IN}=10k$.

For a single-ended operation, input signals to IN+ pin via a DC-cut capacitor (C_{IN}). IN- pin should be connected to ground via a DC-cut capacitor (with the same value of C_{IN}).

Figure 1 (1) Differential Input;

(2) Single-ended Input

2.2 Amplifier Output Configuration

The HT360 has been tested with a simple ferrite bead filter for a variety of applications including long speaker wires up to 20 cm and high power. One important aspect of the ferrite bead selection is the type of material used in the ferrite bead. Not all ferrite material is alike, so it is important to select a material that is effective in the 10 to 100 MHz range which is key to the operation of the class-D amplifier. The impedance of the ferrite bead can be used along with a small capacitor with a value in the range of 1000 pF to reduce the frequency spectrum of the signal to an acceptable level. For best performance, the resonant frequency of the ferrite bead/ capacitor filter should be less than 10 MHz. Also, the filter capacitor can be increased if necessary, with some impact on efficiency.

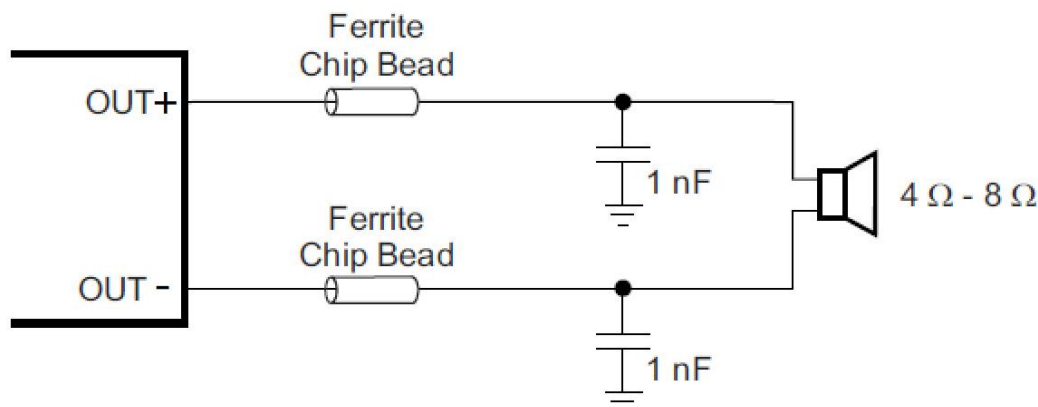

Figure 2 Output Filters with Ferrite Beads

There may be a few circuit instances where it is necessary to add a complete LC reconstruction filter. These circumstances might occur if there are nearby circuits which are sensitive to noise. In these cases, a classic second order Butterworth filter similar to those shown in the figures below can be used.

Some systems have little power supply decoupling from the AC line but are also subject to line conducted interference (LCI) regulations. These include systems powered by "wall warts" and "power bricks." In these cases, LC reconstruction filters can be the lowest cost means to pass LCI tests. Common mode chokes using low frequency ferrite material can also be effective at preventing line conducted interference.

Figure 3 Output Filters with LC

2.3 PBTL Mode Configuration

The HT360 can be configured to drive a single speaker with the two output channels connected in parallel. This mode of operation is called Parallel Bridge Tied Load (PBTL) mode. This mode of operation effectively reduces the output impedance of the amplifier in half, which in turn reduces the power dissipated in the device due to conduction losses through the output FETs. Additionally, since the output channels are working in parallel, it also doubles the amount of current the speaker amplifier can source before hitting the over-current error threshold.

To place the HT360 into PBTL Mode, the LINP and LINN pin should be directly connected to Ground. When operated in PBTL mode, the output pins should be connected as shown in the Typical Application Circuit Diagrams.

In PBTL mode, the amplifier accepts its source signal from the R channel of the stereo signal.

3. Startup, Shutdown

The HT360 employs a shutdown mode of operation designed to reduce supply current (I_{DD}) to the absolute minimum level during periods of nonuse for power conservation. The \SD input terminal should be held high during normal operation when the amplifier is in use. Pulling \SD low will put the outputs to mute and the amplifier to enter a low-current state. It is not recommended to leave \SD unconnected, because amplifier operation would be unpredictable.

For a better power on and power-off pop performance, place the amplifier in the shutdown mode prior to delivering or removing the power supply.

4. Other Functions and Terminals

4.1 GVDD Supply

The GVDD Supply is used to power the gates of the output full bridge transistors. Decouple GVDD with a X5R ceramic 1 μ F capacitor to GND. The GVDD supply is not intended to be used for external supply.

4.2 BSPx和BSNx Capacitors

The full H-bridge output stages use only NMOS transistors. Therefore, they require bootstrap capacitors for the high side of each output to turn on correctly. A 220nF ceramic capacitor of quality X5R or better, rated for at least 16 V, must be connected from each output to its corresponding bootstrap input. The bootstrap capacitors connected between the BSxx pins and corresponding output function as a floating power supply for the high-side N-channel power MOSFET gate drive circuitry. During each high-side switching cycle, the bootstrap capacitors hold the gate-to-source voltage high enough to keep the high-side MOSFETs turned on.

5. Protection Functions

The HT360 contains a complete set of protection circuits carefully designed to make system design efficient as well as to protect the device against any kind of permanent failures due to short circuits, overload, over temperature, under-voltage, and over-voltage.

5.1 Over Temperature Protection (OTP)

This is the function to establish the over temperature protection mode when detecting excessive high temperature of HT360. When the on-die temperature of HT360 is higher than TOP, the OTP mode is activated, the differential output pin becomes weak low state (a state grounded through resistivity), and the SD/FAULT pin is pulled low.

5.2 DC Detect Protection (DCP)

The HT360 has circuitry which will protect the speakers from DC current which might occur due to an internal amplifier error. A DC detect fault will be reported on the SD/FAULT pin as a low state. The DC Detect fault will also cause the amplifier to shutdown by changing the state of the outputs to Hi-Z.

A DCE event occurs when the output differential duty-cycle of either channel exceeds 60% for more than 420 msec at the same polarity. The table below shows some examples of the typical DCE Protection threshold for several values of the supply voltage. This feature protects the speaker from large DC currents or AC currents less than 2 Hz.

5.3 Short-Circuit Protection (OCP) and Automatic Recovery

The HT360 has protection from over current conditions caused by a short circuit on the output stage. The amplifier outputs are switched to a high impedance state when the short circuit protection latch is engaged. The short circuit protection fault is reported on the SD/FAULT pin as a low state.

When OCP or OTP or DC error is detected, the SD/FAULT pin will be pulled low. Because the SD input is low, it clear the error signal. Delay a ton time(normal 1.3s), HT360 will try restart.

5.4 Under-Voltage Protection (UVP)

This is the function to establish the under-voltage protection mode when power supply becomes lower than the detection voltage V_{UVLL} , and the protection mode is canceled when the power supply becomes higher than the threshold voltage V_{UVLH} . In the under-voltage protection mode, the differential output pin becomes weak low state (a stage grounded through resistivity). HT360 will start up within start-up time when the under-voltage protection mode is cancelled.

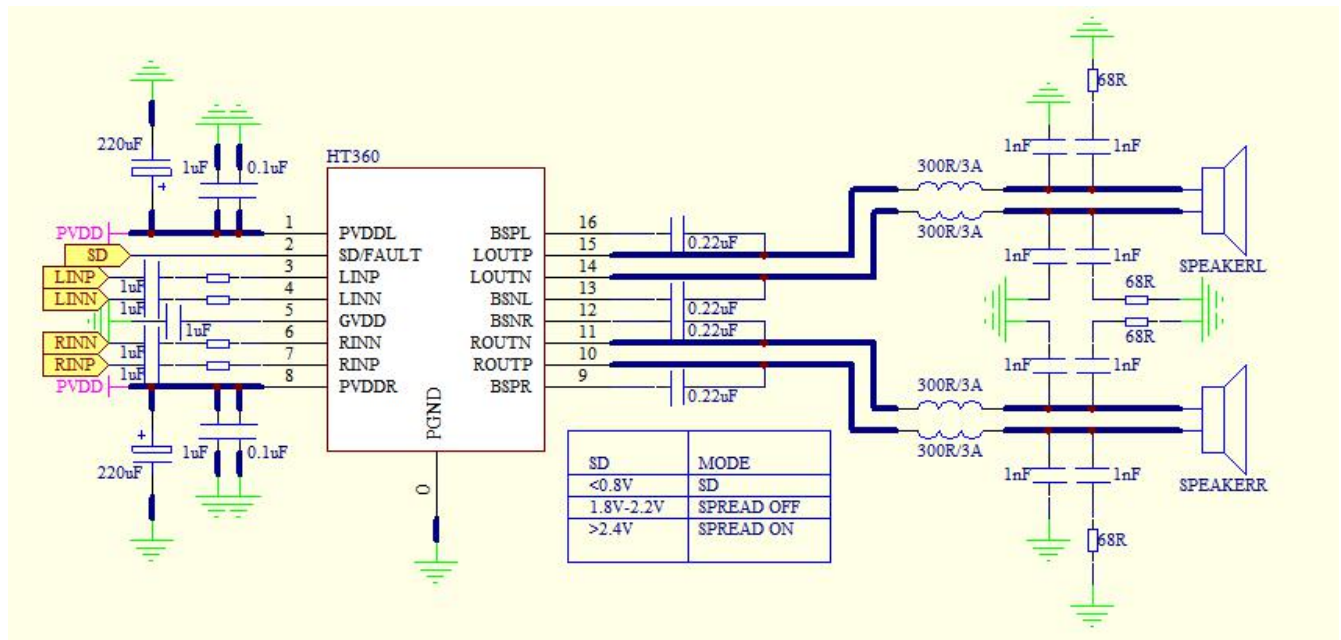

5.5 Uver-Voltage Protection (OVP)

The HT360 device monitors the voltage on PVDD voltage threshold. When the voltage on PVDD pin exceeds the over-voltage threshold (18V typ), the OVP circuit puts the device into shutdown mode. The device recovers automatically once the over-voltage condition has been removed.
